

SoundChex for iPadOS — Terms

App not yet released — terms published ahead

These terms cover the SoundChex app for iPadOS — the client you browse, play and read with. The server it connects to has [its own terms](#).

1. The license is the MIT License

The app is open-source software released by Tripsittr LLC under the MIT License; the license text in the [repository](#) is the complete and only license. It is provided "as is", without warranty of any kind.

2. The app is a window onto your server

- The app connects only to the server address you enter — a machine you (or your household) run. Tripsittr LLC operates no service the app depends on.
 - The interface is served by your server, so its behaviour and content are your server's version of SoundChex. The binary itself carries only the connect screen and the offline shell.
 - Accounts, permissions and content restrictions (including kids mode) are enforced by your server, under its operator's control.
-

3. Your media, your responsibility

The app plays media from a library its operator assembled. It does not acquire media and these terms are not a license to infringe copyright.

4. Downloads live on this device

Media you download for offline use is stored on the device for your use within your household's library. Deleting the app deletes its downloads; the library itself lives on the server and loses nothing.

5. iPadOS specifics

- A dedicated iPad app is planned; today the iPad runs the [iOS build or the web app](#). Until the dedicated app ships, use of the iOS app on iPad is governed by the [iOS terms](#), which are materially identical to these.
 - When it reaches the App Store or TestFlight, Apple's standard end-user terms will apply alongside — not instead of — the MIT License and these terms.
-

No warranty; limitation of liability

As the MIT License states: no warranty, express or implied. To the maximum extent permitted by law, Tripsittr LLC and contributors are not liable for damages arising from the app or its use.

SCNet

If and when this app gains the option to connect through SCNet (the SoundChex Network), that connection will be governed by SCNet's own subscriber terms, published before the service opens — nothing in these terms signs you up for anything.
